1 Introduction

The LibreVNA-GUI contains a TCP server that can be used to control the LibreVNA with SCPI commands.

2 SCPI Server Configuration

The server is configurable in the preferences: Window Preferences General

If enabled, it will accept any TCP connection at the configured port. Once the connection is established, it can be used to send SCPI commands and receive replies. Only one connection at a time is possible, if a second connection is created, the first one will be closed by the LibreVNA-GUI. Alternatively, a port can be manually configured by setting the "port" argument:

```
./LibreVNA-GUI --port 1234
```

This enables the SCPI server at the specified port, regardless of what is configured in the preferences (useful for starting multiple instances at different ports at the same time). If no graphical user interface is required, the LibreVNA-GUI can be hidden:

```
./LibreVNA-GUI --port 1234 --no-gui
```

3 General Syntax

The syntax follows the usual SCPI rules:

- All commands are case insensitive (implicitly converted to uppercase before evaluated)
- The command tree is organized in branches, separated by a colon:

```
: VNA: TRACE: LIST?
```

Multiple commands can be concatenated in one line using a semicolon:

```
:DEVice:CONNECT;:DEVice:INFo:FWRevision?
```

• If a command starts with a colon it is evaluated from the root branch, otherwise the last used branch is assumed:

```
:VNA:FREQuency:START 1000000
STOP 2000000 #No colon, VNA:FREQuency branch was used before
```

• Branches and commands can be abbreviated by using only the uppercase part of their name, the following commands are identical:

```
:DEVice:INFo:LIMits:MINFrequency?
:DEV:INF:LIM:MINF?
```

Every command generates a (possibly empty) response, terminated with a newline character.

• Some commands require additional arguments that have to be passed after the command (separated by spaces):

```
:DEV:REF:OUT 10
```

- Two types of commands are available:
 - Events change a setting or trigger an action. They usually have an empty response (unless there was an error).
 - Queries request information. They end with a question mark.

Some commands are both events and queries, depending on whether the question mark is present:

```
:VNA:FREQ:SPAN 50000000 # Set the span
:VNA:FREQ:SPAN? # Read the current span
```

4.3 VNA Commands

Parameters:	<trace1>,<trace2>,<trace3>,</trace3></trace2></trace1>

Some additional constraints apply:

- The number of specified traces must be a square number. The number of ports in the touchstone file is inferred from that.
- Only frequency domain traces are allowed.
- All traces must have the same number of points and the same start/stop frequency.
- The order in which the traces are specified matters and depending on its index and each trace must be a reflection or transmission measurement:
 - Assuming that n is the number of ports of the desired touchstone file, the n*n number of traces must be specified in this order:

$$S_{11}...S_{1n}, S_{21}...S_{2n}, ..., S_{n1}...S_{nn}$$

- For every trace S_{ij} , the trace must contain a reflection measurement if i = j and a transmission measurement if $i \neq j$.
- Traces can be specified either by name or by index.
- A deviation from any of these points (invalid number of traces, non-existing trace, wrong order, ...) will result in an error being returned.

Example

```
:VNA:TRACE:TOUCHSTONE? S11 S12 S21 S22
